# Essential Foundation Analysis

Providing a Solid and Secure Foundation for a Strong and Safe Security Posture

What is it?

The LRS Foundational Cyber Risk Analysis is our bundled offering that addresses a corporation's security structure; identifying vulnerabilities, threats, and systems that are not functioning within manufacturers' best practices.

Why do we need it?

The FBI reported there was a 300% increase in cybercrime in 2020. Seven out of ten businesses are not prepared to respond to a cyber-attack. Many organizations lack the ability to properly address all the elements of their security posture because their staff is overburdened with day-to-day operational responsibilities. Managing the security and network platforms required to provide perimeter and internal security becomes daunting and these structural areas are prime attack vectors and should be reviewed regularly.

We provide our clients with a detailed remediation plan that provides complete and actionable insights to any vulnerabilities and risks, enabling faster action to correct and improve your security performance.

Why LRS?

The LRS Security team understands the cyber challenges you face every day keeping your organization safe from attacks, and we know how to combat them proactively. With more than 25 years of experience and certifications from ISC2, ISACA, and SANS, along with experience utilizing industry frameworks such as CSC and NIST, we deliver core technologies to companies throughout the United States with the latest technology developments from the best names in the industry.
